# **EOPSY Lab 3 Report**

# **Scheduling**

Author: Jan Radzimiński

Index numer: 293052

# 0. Initial configuration

All the processes run in following simulation were set to:

- have average of 2000 ms
- have standard deviation of zero
- be blocked for I/O every 500ms

All of the following simulations were run for 10 000 ms. All config and output files are attached to the report.

#### **Initial Comment:**

The scheduling algorithm used in following simulation is a First Come First Serve algorithm. It is a non-preemptive - in such algorithms when process enters the running state, it cannot be preempted until it has completed (as the name suggest). In FCFS algorithm, processes are executed based on their arrival time - from most recent to latest.

#### 1. Simulation with 2 processes

#### **Output of Summary Results:**

```
Summary Results:
Scheduling Type: Batch (Nonpreemptive)
Scheduling Name: First-Come First-Served
Simulation Run Time: 4000
Mean: 2000
Standard Deviation: 0
Process # CPU Time IO Blocking CPU Completed CPU Blocked
0 2000 (ms) 500 (ms) 2000 (ms) 3 times
1 2000 (ms) 500 (ms) 2000 (ms) 3 times
```

# **Output of Summary Process:**

```
Process: 0 registered... (2000 500 0 0)
Process: 0 I/O blocked... (2000 500 500 500)
Process: 1 registered... (2000 500 0 0)
Process: 1 I/O blocked... (2000 500 500 500)
Process: 0 registered... (2000 500 500 500)
Process: 0 I/O blocked... (2000 500 1000 1000)
Process: 1 registered... (2000 500 500 500)
Process: 1 I/O blocked... (2000 500 1000 1000)
Process: 0 registered... (2000 500 1000 1000)
Process: 0 I/O blocked... (2000 500 1500 1500)
Process: 1 registered... (2000 500 1000 1000)
Process: 1 I/O blocked... (2000 500 1500 1500)
Process: 0 registered... (2000 500 1500 1500)
Process: 0 completed... (2000 500 2000 2000)
Process: 1 registered... (2000 500 1500 1500)
Process: 1 completed... (2000 500 2000 2000)
```

#### Comment:

As can be seen in *Summary Results*, both processes completed in their set 2000ms time. Whole simulation lasted for only 4000ms since the all processes completed before the 10000ms limit. In *Summary process* we can see that firstly the 0 process gets registered ("accepted for execution" by CPU). Then, according to configuration set, it gets blocked after 500ms. The same happens for process 1 immediately after the process 0 was blocked - its next in the queue. This cycle repeats 4 times, until both processes reach their run time - 2000ms, after which they completed. Since the processes were completed only

after they reached 2000ms (4000ms total sim time), both were blocked exactly 3 times (while reaching time equals to multiples of 500ms), which is also visible in *Process Summary* in *CPU blocked* column.

## 2. Simulation with 5 processes

# **Output of Summary Results:**

```
Scheduling Type: Batch (Nonpreemptive)
Scheduling Name: First-Come First-Served
Simulation Run Time: 10000
Mean: 2000
Standard Deviation: 0

Process: 4 registered... (2000 500 1500 1500)
```

## Comment:

This simulation was run with 5 processes. Since all processes had execution time equal to 2000ms, first 4 of them completed (in total of 8000ms time - 2000ms for each process). Firstly, processes 0 and 1 completed in a identical way as in previous simulation - firstly process 0 was register and blocked after 500ms, after that process 1 was register and blocked, then process 0 was registered (since arrived earlier than any other remaining processes - had higher priority) and so on. After both of them completed identical situation appeared for processes 2 and 3. Then after they completed (at this point total simulation time was 8000ms) the process 4 was registered. Then after every time it was blocked it was registered again since there were none other processes in the queue. However, since the simulation limit time was set to 10000ms the message about process completion did not appear, because the process completion time was exactly the same as simulation limit. Therefore it was only registered after the 3rd I/O block happened and after 500 ms the simulation finished.

## 3. Simulation with 10 processes

## **Output of Summary Results:**

Scheduling Type: Batch (Nonpreemptive)
Scheduling Name: First-Come First-Served

Simulation Run Time: 10000

Mean: 2000

Standard Deviation: 0

Process #	CPU Time	IO Blocking	CPU Completed	CPU Blocked
0	2000 (ms)	500 (ms)	2000 (ms)	3 times
1	2000 (ms)	500 (ms)	2000 (ms)	3 times
2	2000 (ms)	500 (ms)	2000 (ms)	3 times
3	2000 (ms)	500 (ms)	2000 (ms)	3 times
4	2000 (ms)	500 (ms)	1000 (ms)	2 times
5	2000 (ms)	500 (ms)	1000 (ms)	1 times
6	2000 (ms)	500 (ms)	0 (ms)	0 times
7	2000 (ms)	500 (ms)	0 (ms)	0 times
8	2000 (ms)	500 (ms)	0 (ms)	0 times
9	2000 (ms)	500 (ms)	0 (ms)	0 times

# **Output of Summary Process:**

Process: 5 registered... (2000 500 500 500)
```

#### Comment:

In this simulation, in *Summary Results* we can see that only 4 processes completed their 2000ms time - processes from 0 to 3. The processes 4 and 5 were executed only for 1000ms, while processes from 6 to 9 weren't completed at all. In Summary process we can see that first 8000ms of simulation is identical as in previous one - the process 0 and 1 are executed after each other is blocked since they have the highest priority and they complete after 2000ms. The same happens for 2 and 3. Then the process 4 gets registered and after its blocked (after 500ms) the process 5 registers (it's the next process in queue with the highest priority). At this point total simulation time is 8500ms. Then after 500ms process 5 gets blocked, the process 4 registers again, after 500ms it gets blocked, and again process 5 is registered. At this point total simulation time is 9500ms, therefore after 500ms the simulation ends and the process 5 doesn't get blocked anymore (since didn't happen in 10000ms limit). All of these is also visible in Summary Results - first 4 processes were blocked 3 times (as in previous simulations), while 4th process was blocked 2 times and 5th only once. Other processes weren't even registered, since the time ran out.
